## Chapter 1

# SUNDIALS Package Installation Procedure

The installation of any SUNDIALS package is accomplished by installing the SUNDIALS suite as a whole, according to the instructions that follow. The same procedure applies whether or not the downloaded file contains one or all solvers in SUNDIALS.

The SUNDIALS suite (or individual solvers) are distributed as compressed archives (.tar.gz). The name of the distribution archive is of the form solver-x.y.z.tar.gz, where solver is one of: sundials, cvode, cvodes, ida, idas, or kinsol, and x.y.z represents the version number (of the SUNDIALS suite or of the individual solver). To begin the installation, first uncompress and expand the sources, by issuing

% tar xzf solver-x.y.z.tar.gz

This will extract source files under a directory *solver*-x.y.z.

Starting with version 2.6.0 of SUNDIALS, CMake is the only supported method of installation. The explanations on the installation procedure begins with a few common observations:

• The remainder of this chapter will follow these conventions:

srcdir is the directory solver-x.y.z created above; i.e., the directory containing the SUNDIALS sources.

builddir is the (temporary) directory under which SUNDIALS is built.

installdir is the directory under which the SUNDIALS exported header files and libraries will be installed. Typically, header files are exported under a directory installdir/include while libraries are installed under installdir/lib, with installdir specified at configuration time.

- For SUNDIALS CMake-based installation, in-source builds are prohibited; in other words, the build directory *builddir* can **not** be the same as *srcdir* and such an attempt will lead to an error. This prevents "polluting" the source tree and allows efficient builds for different configurations and/or options.
- The installation directory *installdir* can **not** be the same as the source directory *srcdir*.
- By default, only the libraries and header files are exported to the installation directory installdir. If enabled by the user (with the appropriate toggle for CMake), the examples distributed with SUNDIALS will be built together with the solver libraries but the installation step will result in exporting (by default in a subdirectory of the installation directory) the example sources and sample outputs together with automatically generated configuration files that reference the installed SUNDIALS headers and libraries. As such, these configuration files for the SUNDIALS examples can be used as "templates" for your own problems. CMake installs CMakeLists.txt files and also (as an option available only under Unix/Linux) makefiles. Note this installation

approach also allows the option of building the SUNDIALS examples without having to install them. (This can be used as a sanity check for the freshly built libraries.)

• Even if generation of shared libraries is enabled, only static libraries are created for the FCMIX modules. (Because of the use of fixed names for the Fortran user-provided subroutines, FCMIX shared libraries would result in "undefined symbol" errors at link time.)

#### 1.1 CMake-based installation

CMake-based installation provides a platform-independent build system. CMake can generate Unix and Linux Makefiles, as well as KDevelop, Visual Studio, and (Apple) XCode project files from the same configuration file. In addition, CMake also provides a GUI front end and which allows an interactive build and installation process.

The SUNDIALS build process requires CMake version 2.8.1 or higher and a working compiler. On Unix-like operating systems, it also requires Make (and curses, including its development libraries, for the GUI front end to CMake, ccmake), while on Windows it requires Visual Studio. While many Linux distributions offer CMake, the version included is probably out of date. Many new CMake features have been added recently, and you should download the latest version from http://www.cmake.org. Build instructions for CMake (only necessary for Unix-like systems) can be found on the CMake website. Once CMake is installed, Linux/Unix users will be able to use ccmake, while Windows users will be able to use CMakeSetup.

As previously noted, when using CMake to configure, build and install SUNDIALS, it is always required to use a separate build directory. While in-source builds are possible, they are explicitly prohibited by the SUNDIALS CMake scripts (one of the reasons being that, unlike autotools, CMake does not provide a make distclean procedure and it is therefore difficult to clean-up the source tree after an in-source build). By ensuring a separate build directory, it is an easy task for the user to clean-up all traces of the build by simply removing the build directory. CMake does generate a make clean which will remove files generated by the compiler and linker.

#### 1.1.1 Configuring, building, and installing on Unix-like systems

The default CMake configuration will build all included solvers and associated examples and will build static and shared libraries. The *installdir* defaults to /usr/local and can be changed by setting the CMAKE\_INSTALL\_PREFIX variable. Support for FORTRAN and all other options are disabled.

CMake can be used from the command line with the cmake command, or from a curses-based GUI by using the ccmake command. Examples for using both methods will be presented. For the examples shown it is assumed that there is a top level SUNDIALS directory with appropriate source, build and install directories:

```
% mkdir (...)sundials/installdir
% mkdir (...)sundials/builddir
% cd (...)sundials/builddir
```

#### Building with the GUI

Using CMake with the GUI follows this general process:

- Select and modify values, run configure (c key)
- New values are denoted with an asterisk
- To set a variable, move the cursor to the variable and press enter
  - If it is a boolean (ON/OFF) it will toggle the value
  - If it is string or file, it will allow editing of the string

- For file and directories, the <tab> key can be used to complete
- Repeat until all values are set as desired and the generate option is available (g key)
- Some variables (advanced variables) are not visible right away
- To see advanced variables, toggle to advanced mode (t key)
- $\bullet$  To search for a variable press / key, and to repeat the search, press the n key

To build the default configuration using the GUI, from the builddir enter the ccmake command and point to the sourcedir:

#### % ccmake ../sourcedir

The default configuration screen is shown in Figure 1.1.

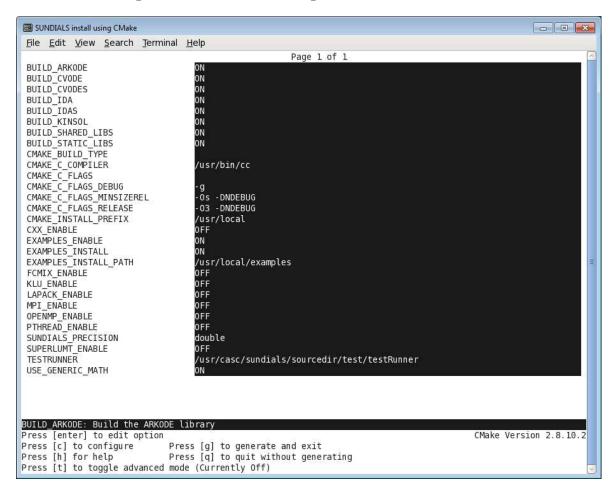

Figure 1.1: Default configuration screen. Note: Initial screen is empty. To get this default configuration, press 'c' repeatedly (accepting default values denoted with asterisk) until the 'g' option is available.

The default *installdir* for both SUNDIALS and corresponding examples can be changed by setting the CMAKE\_INSTALL\_PREFIX and the EXAMPLES\_INSTALL\_PATH as shown in figure 1.2.

Pressing the (g key) will generate makefiles including all dependencies and all rules to build SUN-DIALS on this system. Back at the command prompt, you can now run:

% make

```
SUNDIALS install using CMake

Figure 1.2: Changing the installdir for SUNDIALS and corresponding examples

To install SUNDIALS in the installation directory specified in the configuration, simply run:

% make install

#### Building from the command line

Using CMake from the command line is simply a matter of specifying CMake variable settings with the cmake command. The following will build the default configuration:

```
% cmake -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/installdir \
> -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/installdir/examples \
> ../sourcedir
% make
% make test
```

### 1.1.2 Configuration options (Unix/Linux)

A complete list of all available options for a CMake-based SUNDIALS configuration is provide below. Note that the default values shown are for a typical configuration on a Linux system and are provided as illustration only.

```
 \begin{array}{c} {\tt BUILD\_ARKODE} \ - \ {\tt Build} \ \ {\tt the} \ \ {\tt ARKODE} \ \ {\tt library} \\ {\tt Default:} \ \ {\tt ON} \end{array}
```

BUILD\_CVODE - Build the CVODE library

Default: ON

BUILD\_CVODES - Build the CVODES library

Default: ON

BUILD\_IDA - Build the IDA library

Default: ON

BUILD\_IDAS - Build the IDAS library

Default: ON

BUILD\_KINSOL - Build the KINSOL library

Default: ON

BUILD\_SHARED\_LIBS - Build shared libraries

Default: OFF

BUILD\_STATIC\_LIBS - Build static libraries

Default: ON

CMAKE\_BUILD\_TYPE - Choose the type of build, options are: None (CMAKE\_C\_FLAGS used) Debug

Release RelWithDebInfo MinSizeRel

Default:

CMAKE\_C\_COMPILER - C compiler

Default: /usr/bin/cc

CMAKE\_C\_FLAGS - Flags for C compiler

Default:

CMAKE\_C\_FLAGS\_DEBUG - Flags used by the compiler during debug builds

Default: -g

CMAKE\_C\_FLAGS\_MINSIZEREL - Flags used by the compiler during release minsize builds

Default: -Os -DNDEBUG

CMAKE\_C\_FLAGS\_RELEASE - Flags used by the compiler during release builds

Default: -O3 -DNDEBUG

CMAKE\_Fortran\_COMPILER - Fortran compiler

Default: /usr/bin/gfortran

Note: Fortran support (and all related options) are triggered only if either Fortran-C support is enabled (FCMIX\_ENABLE is ON) or Blas/Lapack support is enabled (LAPACK\_ENABLE is ON).

 ${\tt CMAKE\_Fortran\_FLAGS} \ - \ {\tt Flags} \ for \ Fortran \ compiler$ 

Default:

 ${\tt CMAKE\_Fortran\_FLAGS\_DEBUG~- Flags~used~by~the~compiler~during~debug~builds}$ 

Default:

 ${\tt CMAKE\_Fortran\_FLAGS\_MINSIZEREL~Flags~used~by~the~compiler~during~release~minsize~builds}$ 

Default:

CMAKE\_Fortran\_FLAGS\_RELEASE - Flags used by the compiler during release builds

Default:

CMAKE\_INSTALL\_PREFIX - Install path prefix, prepended onto install directories

Default: /usr/local

Note: The user must have write access to the location specified through this option. Exported SUNDIALS header files and libraries will be installed under subdirectories include and lib of CMAKE\_INSTALL\_PREFIX, respectively.

#### EXAMPLES\_ENABLE - Build the SUNDIALS examples

Default: ON

#### EXAMPLES\_INSTALL - Install example files

Default: ON

Note: This option is triggered only if building example programs is enabled (EXAMPLES\_ENABLE ON). If the user requires installation of example programs then the sources and sample output files for all SUNDIALS modules that are currently enabled will be exported to the directory specified by EXAMPLES\_INSTALL\_PATH. A CMake configuration script will also be automatically generated and exported to the same directory. Additionally, if the configuration is done under a Unix-like system, makefiles for the compilation of the example programs (using the installed SUNDIALS libraries) will be automatically generated and exported to the directory specified by EXAMPLES\_INSTALL\_PATH.

#### EXAMPLES\_INSTALL\_PATH - Output directory for installing example files

Default: /usr/local/examples

Note: The actual default value for this option will an examples subdirectory created under CMAKE\_INSTALL\_PREFIX.

#### FCMIX\_ENABLE - Enable Fortran-C support

Default: OFF

#### KLU\_ENABLE - Enable KLU support

Default: OFF

#### LAPACK\_ENABLE - Enable Lapack support

Default: OFF

Note: Setting this option to ON will trigger the two additional options see below.

#### LAPACK\_LIBRARIES - Lapack (and Blas) libraries

Default: /usr/lib/liblapack.so;/usr/lib/libblas.so

Note: CMake will search for these libraries in your LD\_LIBRARY\_PATH prior to searching default

system paths.

#### MPI\_ENABLE - Enable MPI support

Default: OFF

Note: Setting this option to ON will trigger several additional options related to MPI.

#### MPI\_MPICC - mpicc program

Default:

#### MPI\_RUN\_COMMAND - Specify run command for MPI

Default: mpirun

Note: This can either be set to mpirun for OpenMPI or srun if jobs are managed by SLURM - Simple Linux Utility for Resource Management as exists on LLNL's high performance computing clusters.

### ${\tt MPI\_MPIF77-mpif77~program}$

Default:

Note: This option is triggered only if using MPI compiler scripts (MPI\_USE\_MPISCRIPTS is ON) and Fortran-C support is enabled (FCMIx\_ENABLE is ON).

#### OPENMP\_ENABLE - Enable OpenMP support

Default: OFF

Turn on support for the OpenMP based nvector.

```
PTHREAD_ENABLE - Enable Pthreads support
     Default: OFF
     Turn on support for the Pthreads based nvector.
SUNDIALS_PRECISION - Precision used in SUNDIALS, options are: double, single or extended
     Default: double
SUPERLUMT_ENABLE - Enable SUPERLU_MT support
     Default: OFF
TESTRUNNER - Location of testRunner script
     Default: sourcedir/testRunner
USE_GENERIC_MATH - Use generic (stdc) math libraries
     Default: ON
```

#### 1.1.3 Configuration examples

The following examples will help demonstrate usage of the CMake configure options.

To configure SUNDIALS using the default C and Fortran compilers, and default mpicc and mpif77 parallel compilers, enable compilation of examples, and install libraries, headers, and example sources under subdirectories of /home/myname/sundials/, use:

```
% cmake \
   > -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/installdir \
   > -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/installdir/examples \
   > -DMPI_ENABLE=ON \
   > -DFCMIX_ENABLE=ON \
   > /home/myname/sundials/sourcedir
   % make install
To disable installation of the examples, use:
```

```
% cmake \
> -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/installdir \
> -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/installdir/examples \
> -DMPI ENABLE=ON \
> -DFCMIX_ENABLE=ON \
> -DEXAMPLES_INSTALL=OFF \
> /home/myname/sundials/sourcedir
% make install
```

#### Working with external Libraries 1.1.4

The SUNDIALS Suite contains many options to enable implementation flexibility when developing solutions. The following are some notes addressing specific configurations when using the supported third party libraries.

#### Building with LAPACK and BLAS

To enable LAPACK and BLAS libraries, set the LAPACK\_ENABLE option to ON. If the directory containing the LAPACK and BLAS libraries is in the LD\_LIBRARY\_PATH environment variable, CMake will set the LAPACK\_LIBRARIES variable accordingly, otherwise CMake will attemp to find the LAPACK

and BLAS libraries in standard system locations. To explicitly tell CMake what libraries to use, the LAPACK\_LIBRARIES varible can be set to the desired libraries. Example:

```
% cmake \
> -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/installdir \
> -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/installdir/examples \
> -DLAPACK_LIBRARIES=/mypath/lib/liblapack.so;/mypath/lib/libblas.so \
> /home/myname/sundials/sourcedir
%
% make install
%
```

#### Building with KLU

The KLU libraries are part of SuiteSparse, a suite of sparse matrix software, available from the Texas A&M University website: http://faculty.cse.tamu.edu/davis/suitesparse.html SUNDIALS has been tested with SuiteSparse version 4.2.1. To enable KLU, set KLU\_ENABLE to ON, set KLU\_INCLUDE\_DIR to the include path of the KLU installation and set KLU\_LIBRARY\_DIR to the lib path of the KLU installation. The CMake configure will result in populating the variables: AMD\_LIBRARY, AMD\_LIBRARY\_DIR, BTF\_LIBRARY, BTF\_LIBRARY\_DIR, COLAMD\_LIBRARY, COLAMD\_LIBRARY\_DIR, and KLU\_LIBRARY

#### Building with SuperLU\_MT

The SuperLU\_MT libraries are available for download from the Lawrence Berkeley National Laboratory website: http://crd-legacy.lbl.gov/~xiaoye/SuperLU/#superlu\_mt. SUNDIALS has been tested with SuperLU\_MT version 2.4. To enable SuperLU\_MT, set SUPERLUMT\_ENABLE to ON, set SUPERLUMT\_INCLUDE\_DIR to the SRC path of the SuperLU\_MT installation and set SUPERLUMT\_LIBRARY\_DIR to the lib path of the SuperLU\_MT installation. Also, the SUPERLUMT\_THREAD\_TYPE must be set to either Pthread or OpenMP.

Do not mix thread types when building SUNDIALS solvers. If threading is enabled for SUNDIALS by having either OPENMP\_ENABLE or PTHREAD\_ENABLE set to ON then SuperLU\_MT should be set to use the same threading type.

## 1.2 Building and Running Examples

Each of the SUNDIALS solvers is distributed with a set of examples demonstrating basic usage. To build and install the examples, set both EXAMPLES\_ENABLE and EXAMPLES\_INSTALL to ON. Specify the installation path for the examples with the variable EXAMPLES\_INSTALL\_PATH. CMake will generate CMakeLists.txt configuration files (and Makefile files if on Linux/Unix) that reference the *installed* SUNDIALS headers and libraries.

From within the installed example directory, run CMake (either with the GUI or command line) to compile the example code. The resulting output from running the example can be compared with example output bundled in the SUNDIALS distribution.

NOTE: There will likely differences in the output due to machine architecture, compiler versions, use of third party libraries etc.

These examples with the installed configuration files can be used as "templates" for user developed solutions.

## 1.3 Configuring, building, and installing on Windows

Use CMakeSetup from the CMake install location. Make sure to select the appropriate source and the build directory. Also, make sure to pick the appropriate generator (on Visual Studio 6, pick the

Visual Studio 6 generator). Some CMake versions will ask you to select the generator the first time you press Configure instead of having a drop-down menu in the main dialog.

CMake will now create Visual Studio project files. You should now be able to open the SUNDIALS project (or workspace) file. Make sure to select the appropriate build type (Debug, Release, ...). To build SUNDIALS, simply build the ALL\_BUILD target. To install SUNDIALS, simply run the INSTALL target within the build system.

## 1.4 Installed libraries and exported header files

Using the CMake SUNDIALS build system, the command

% make install

will install the libraries under *libdir* and the public header files under *includedir*. The default values for these directories are *instdir*/lib and *instdir*/include, respectively, but can be changed using the configure script options --prefix, --exec-prefix, --includedir and --libdir (see the appropriate CMake options). For example, a global installation of SUNDIALS on a \*NIX system could be accomplished using

% configure --prefix=/opt/sundials-2.1.1

Although all installed libraries reside under *libdir*, the public header files are further organized into subdirectories under *includedir*.

The installed libraries and exported header files are listed for reference in Tables 1.1 and 1.2. The file extension .lib is typically .so for shared libraries and .a for static libraries. Note that, in the Tables, names are relative to libdir for libraries and to includedir for header files.

A typical user program need not explicitly include any of the shared SUNDIALS header files from under the *includedir*/sundials directory since they are explicitly included by the appropriate solver header files (e.g., cvode\_dense.h includes sundials\_dense.h). However, it is both legal and safe to do so (e.g., the functions declared in sundials\_dense.h could be used in building a preconditioner).

Table 1.1: SUNDIALS libraries and header files

| SHARED            | Libraries     | n/a                           |                                |
|-------------------|---------------|-------------------------------|--------------------------------|
| Similar           | Header files  | sundials/sundials_config.h    | sundials/sundials_types.h      |
|                   | Trouder mes   | sundials/sundials_math.h      | sariarais/sariarais_typos.ir   |
|                   |               | sundials/sundials_nvector.h   | sundials/sundials_fnvector.h   |
|                   |               | sundials/sundials_direct.h    | sundials/sundials_lapack.h     |
|                   |               | sundials/sundials_dense.h     | sundials/sundials_band.h       |
